MACHINE BUILDING PLANTS INCREASE PRODUCTION

"Il'marine" Machine-Building Plant workers a few days ago delivered three TEM peat-excavating machines to the "Lekhtse" and "Lavassaare" peat fields. One of these machines, used along with the FSM electric drilling machine, replaces 80 peat workers.

The machine builders are finishing the production of the first group of a new highly productive peat-cutting machine. This new machine, designed by the plant design bureau, cuts 180 cubic meters of peat per hour. The first two of these machines will be sent to the "Tootsi" peat field. The plant will also build two TUM peat-excavating machines by 1 July.

For a long time after the Andizhan "Strommashina" Plant started the production of the Andizhanets Diesel, the plant was unable to master the production of a very important part - the needle valve for the fuel injector. The tool shop could only produce two or three of these parts a day. Now, however, a stakhanovite worker has succeeded in producing 20 of these parts a day, enough for 20 Diesels. The group producing these parts has pledged to produce 250 above plan this year.

The Andizhan "Strommashina" Plant is producing the Andizhanets-13 Diesel engine for use in road construction and in agriculture.
